

gRParse sample document

This page carries a digital text layer, so the service extracts it natively and skips OCR entirely. Boxes drawn solid in the demo are digital text; dashed boxes on the next page come from RapidOCR.

What the stream carries

- One page event per page, in page order, the moment each page finishes
- Provenance boxes and append-only UTF offsets for every text item
- Table cell grids, picture classifications, and decoded barcodes

Pipeline stages

Stage	Backing	Bound
Render	Poppler	Render queue
Inference	ONNX Runtime	Session pool
Assembly	Arena protobuf	Page window

The next page is a scanned-style raster: no text layer, a figure, and a QR code. Watch the OCR, picture, and barcode counters move when it lands.

Scanned page: OCR, figures, barcode

This page has no digital text layer. Every line here reaches the demo through RapidOCR, so its boxes render dashed.

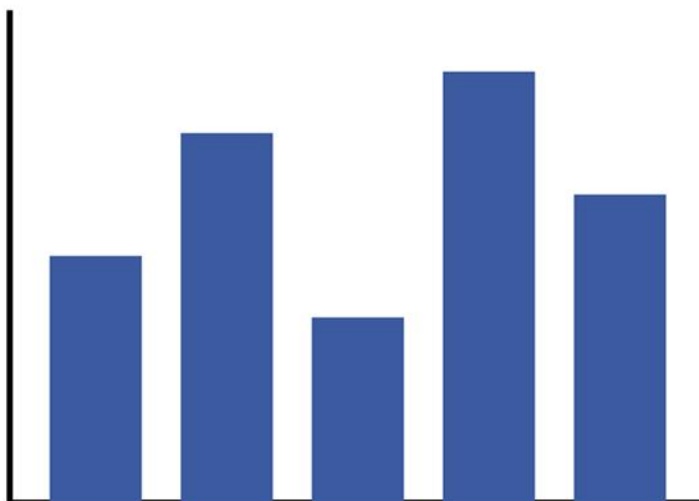

Figure 1: quarterly volume, classified by the figure model.

Figure 2: the QR payload decodes in-process via ZXing and rides the picture item as a barcode annotation.
